

# Milestone 2 - Front end

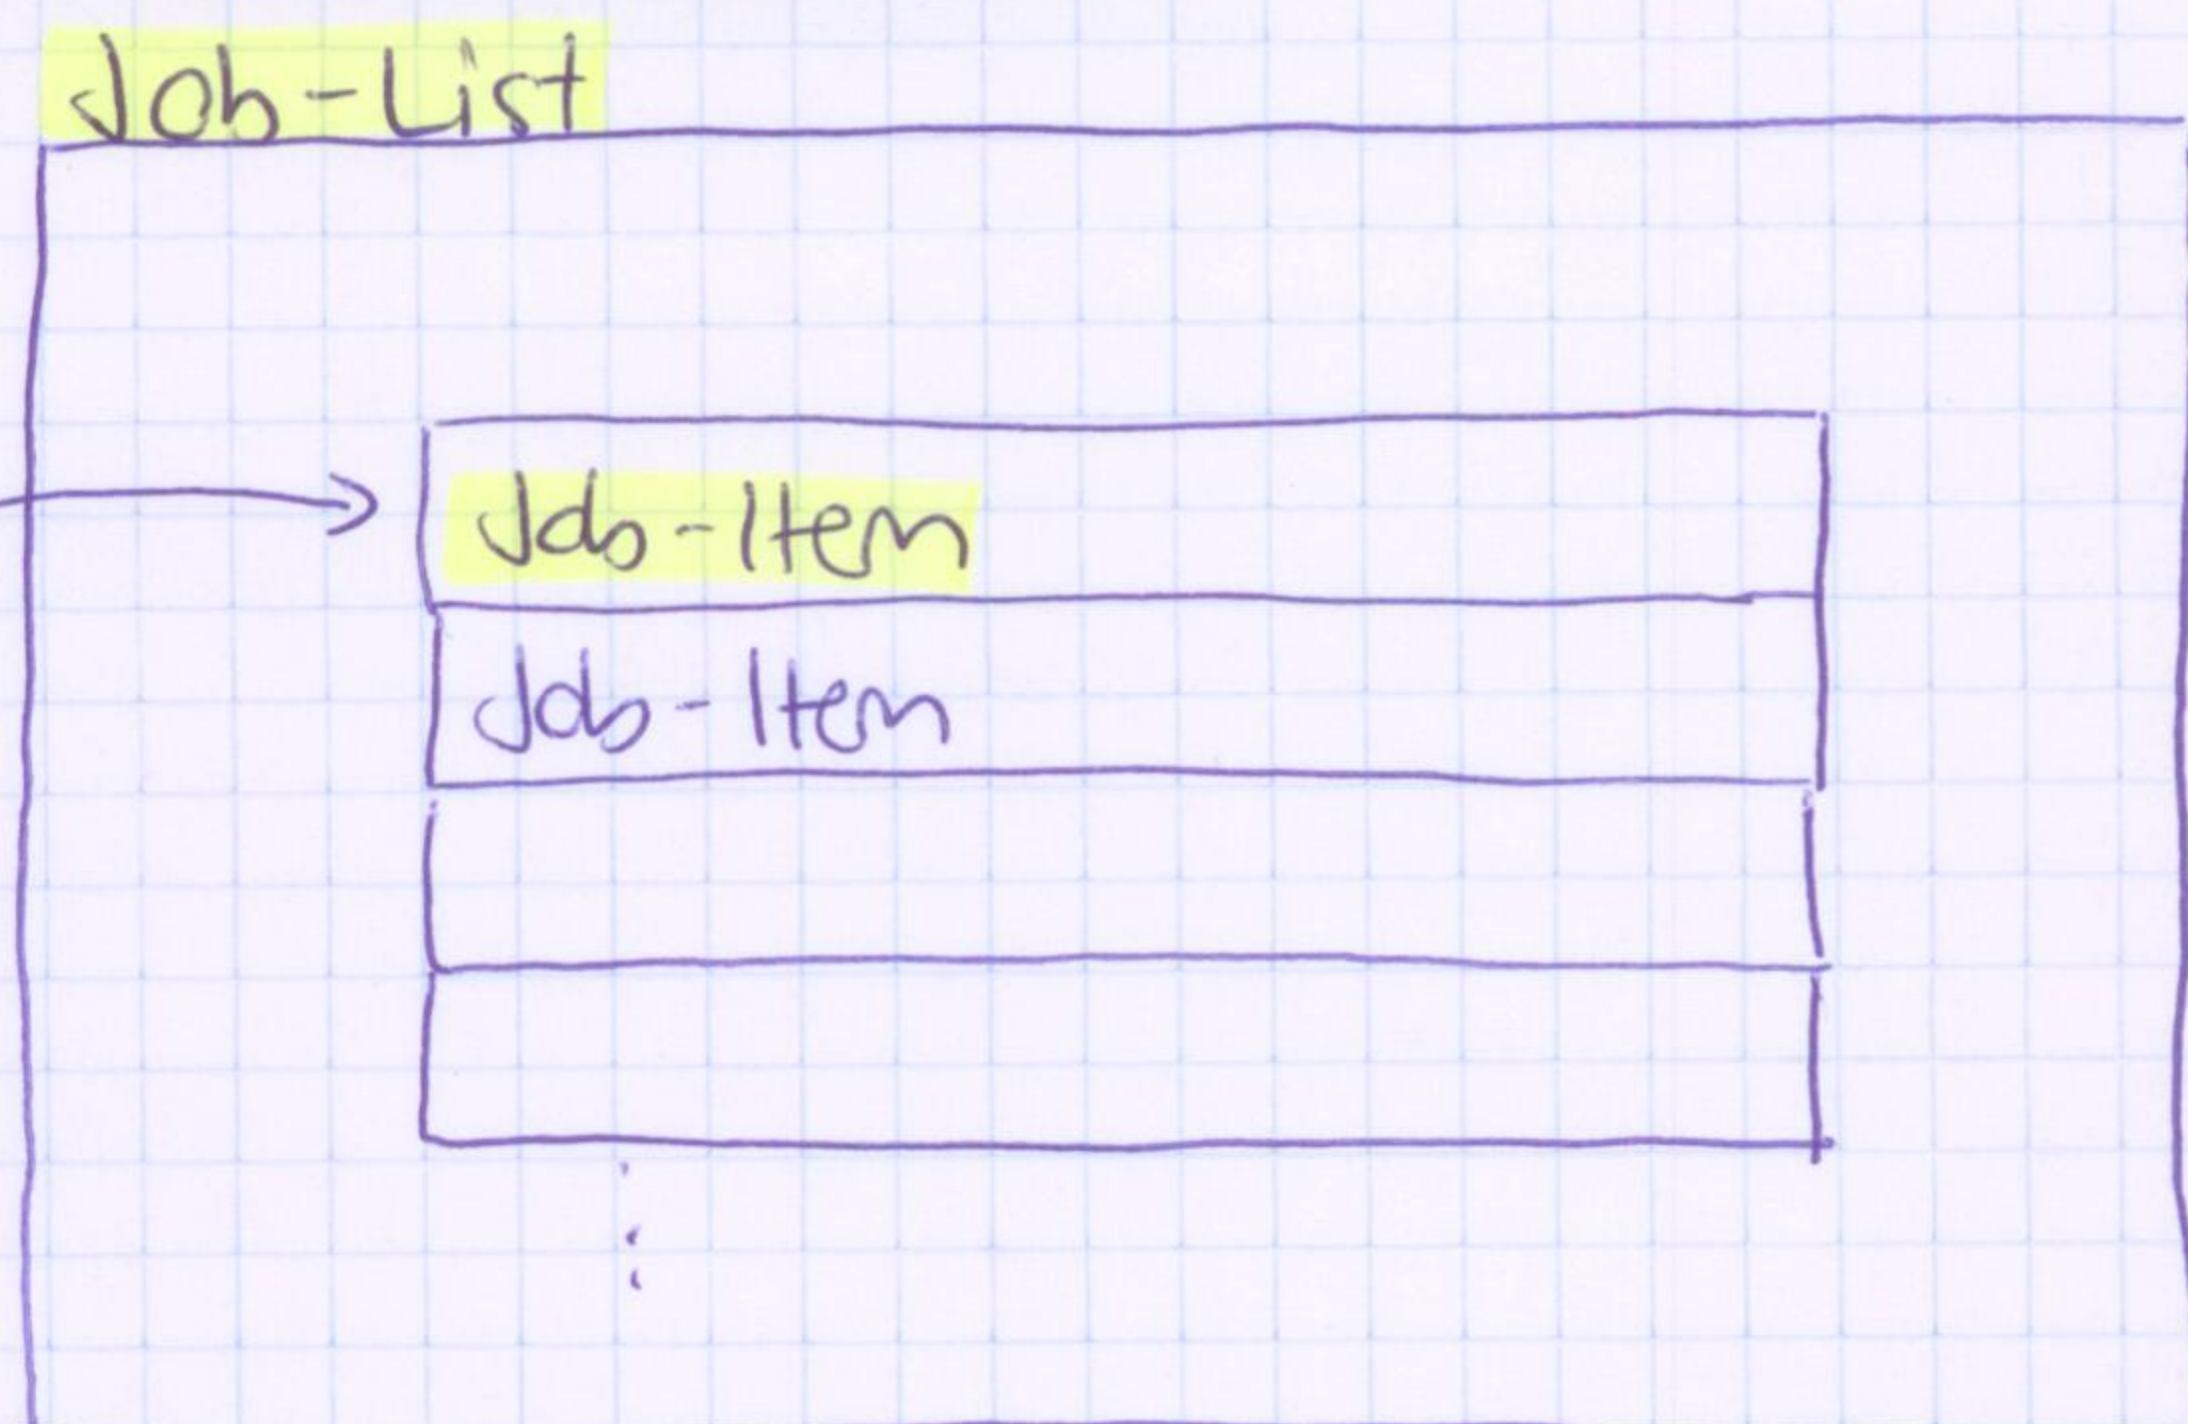

Angular Component

## Job-List

The Job-List component shows all available accepted job postings. They will be displayed as a list. Each

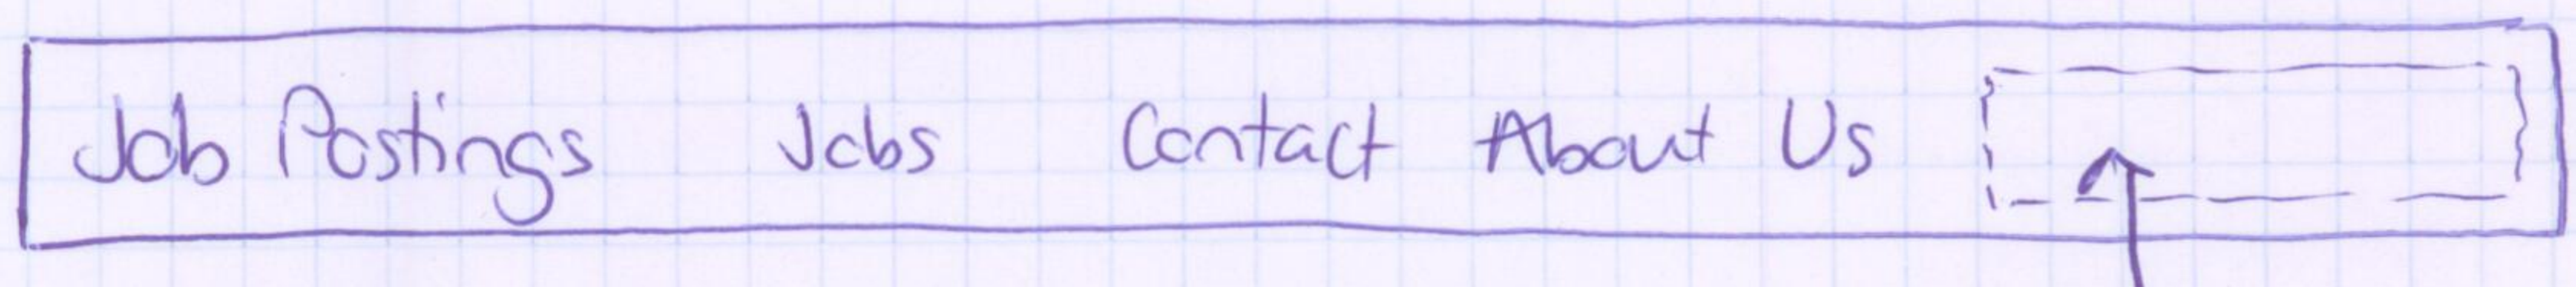

job-offer will display

some basic details (title, description, place etc.) using the Job-Item component. Clicking on an item will redirect to the Job-Detail page/component, showing all details for this job.

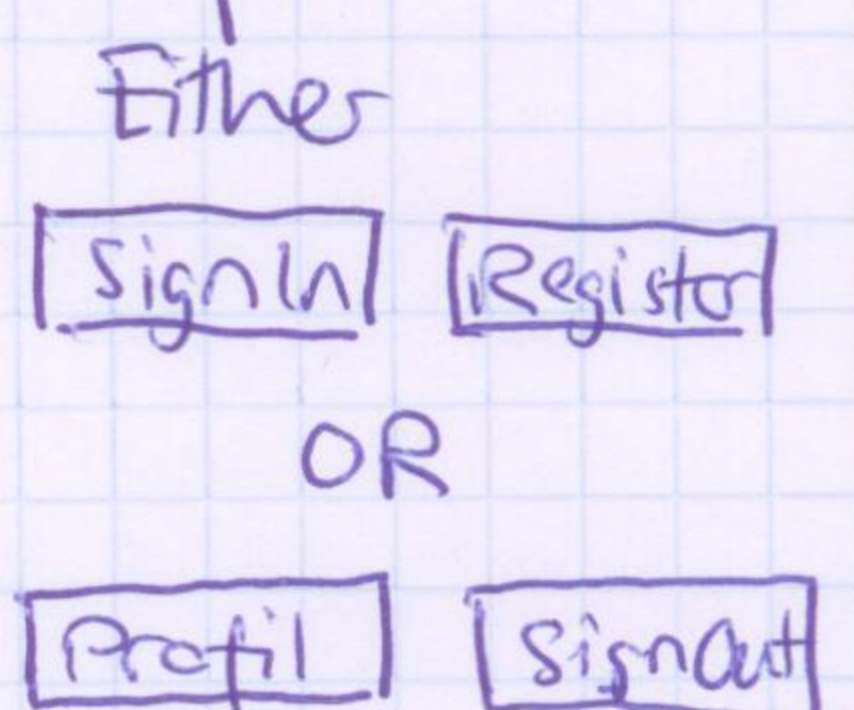

The two components **Contact** and **About Us** are just some placeholders which could potentially have more details about the website itself. For now, we add them for completion.

## Header

The header should contain the 3 main pages Jobs / Contact / About Us. In the top-right corner, we want to display some buttons. New users (not logged in) should have the option to sign in or register while returning users have the option to visit their account page or sign out.

> Admin

## Footer

A sticky footer at the bottom of the page. Should contain a link that leads to the admin page only he can reach.

## User-Login

E-Mail   
Password

A simple form with e-mail and password input to login. Should contain form validation that checks if user input is valid (sending login request only possible if required fields like e-mail and password are filled in). Also give feedback to user from error messages from backend (if e-mail is wrong etc.). Should redirect to my-account page if logged in successfully.

## User-Register

Similar to User-Login, but more complex. User can create new account as an unverified company. Should include form validation (2 PW must match; have name, city etc.) and error feedback (from backend). Redirect to my-account when submitted.

## My-Account

Only accessible when logged in (have valid token). Shows User/Company details. Allows Read-, Update- and Delete-Operations on your User and Job-Postings. Current User-Data is displayed in similar form like in User-

My-Account

User & Company  
Details

My-Job-Posting

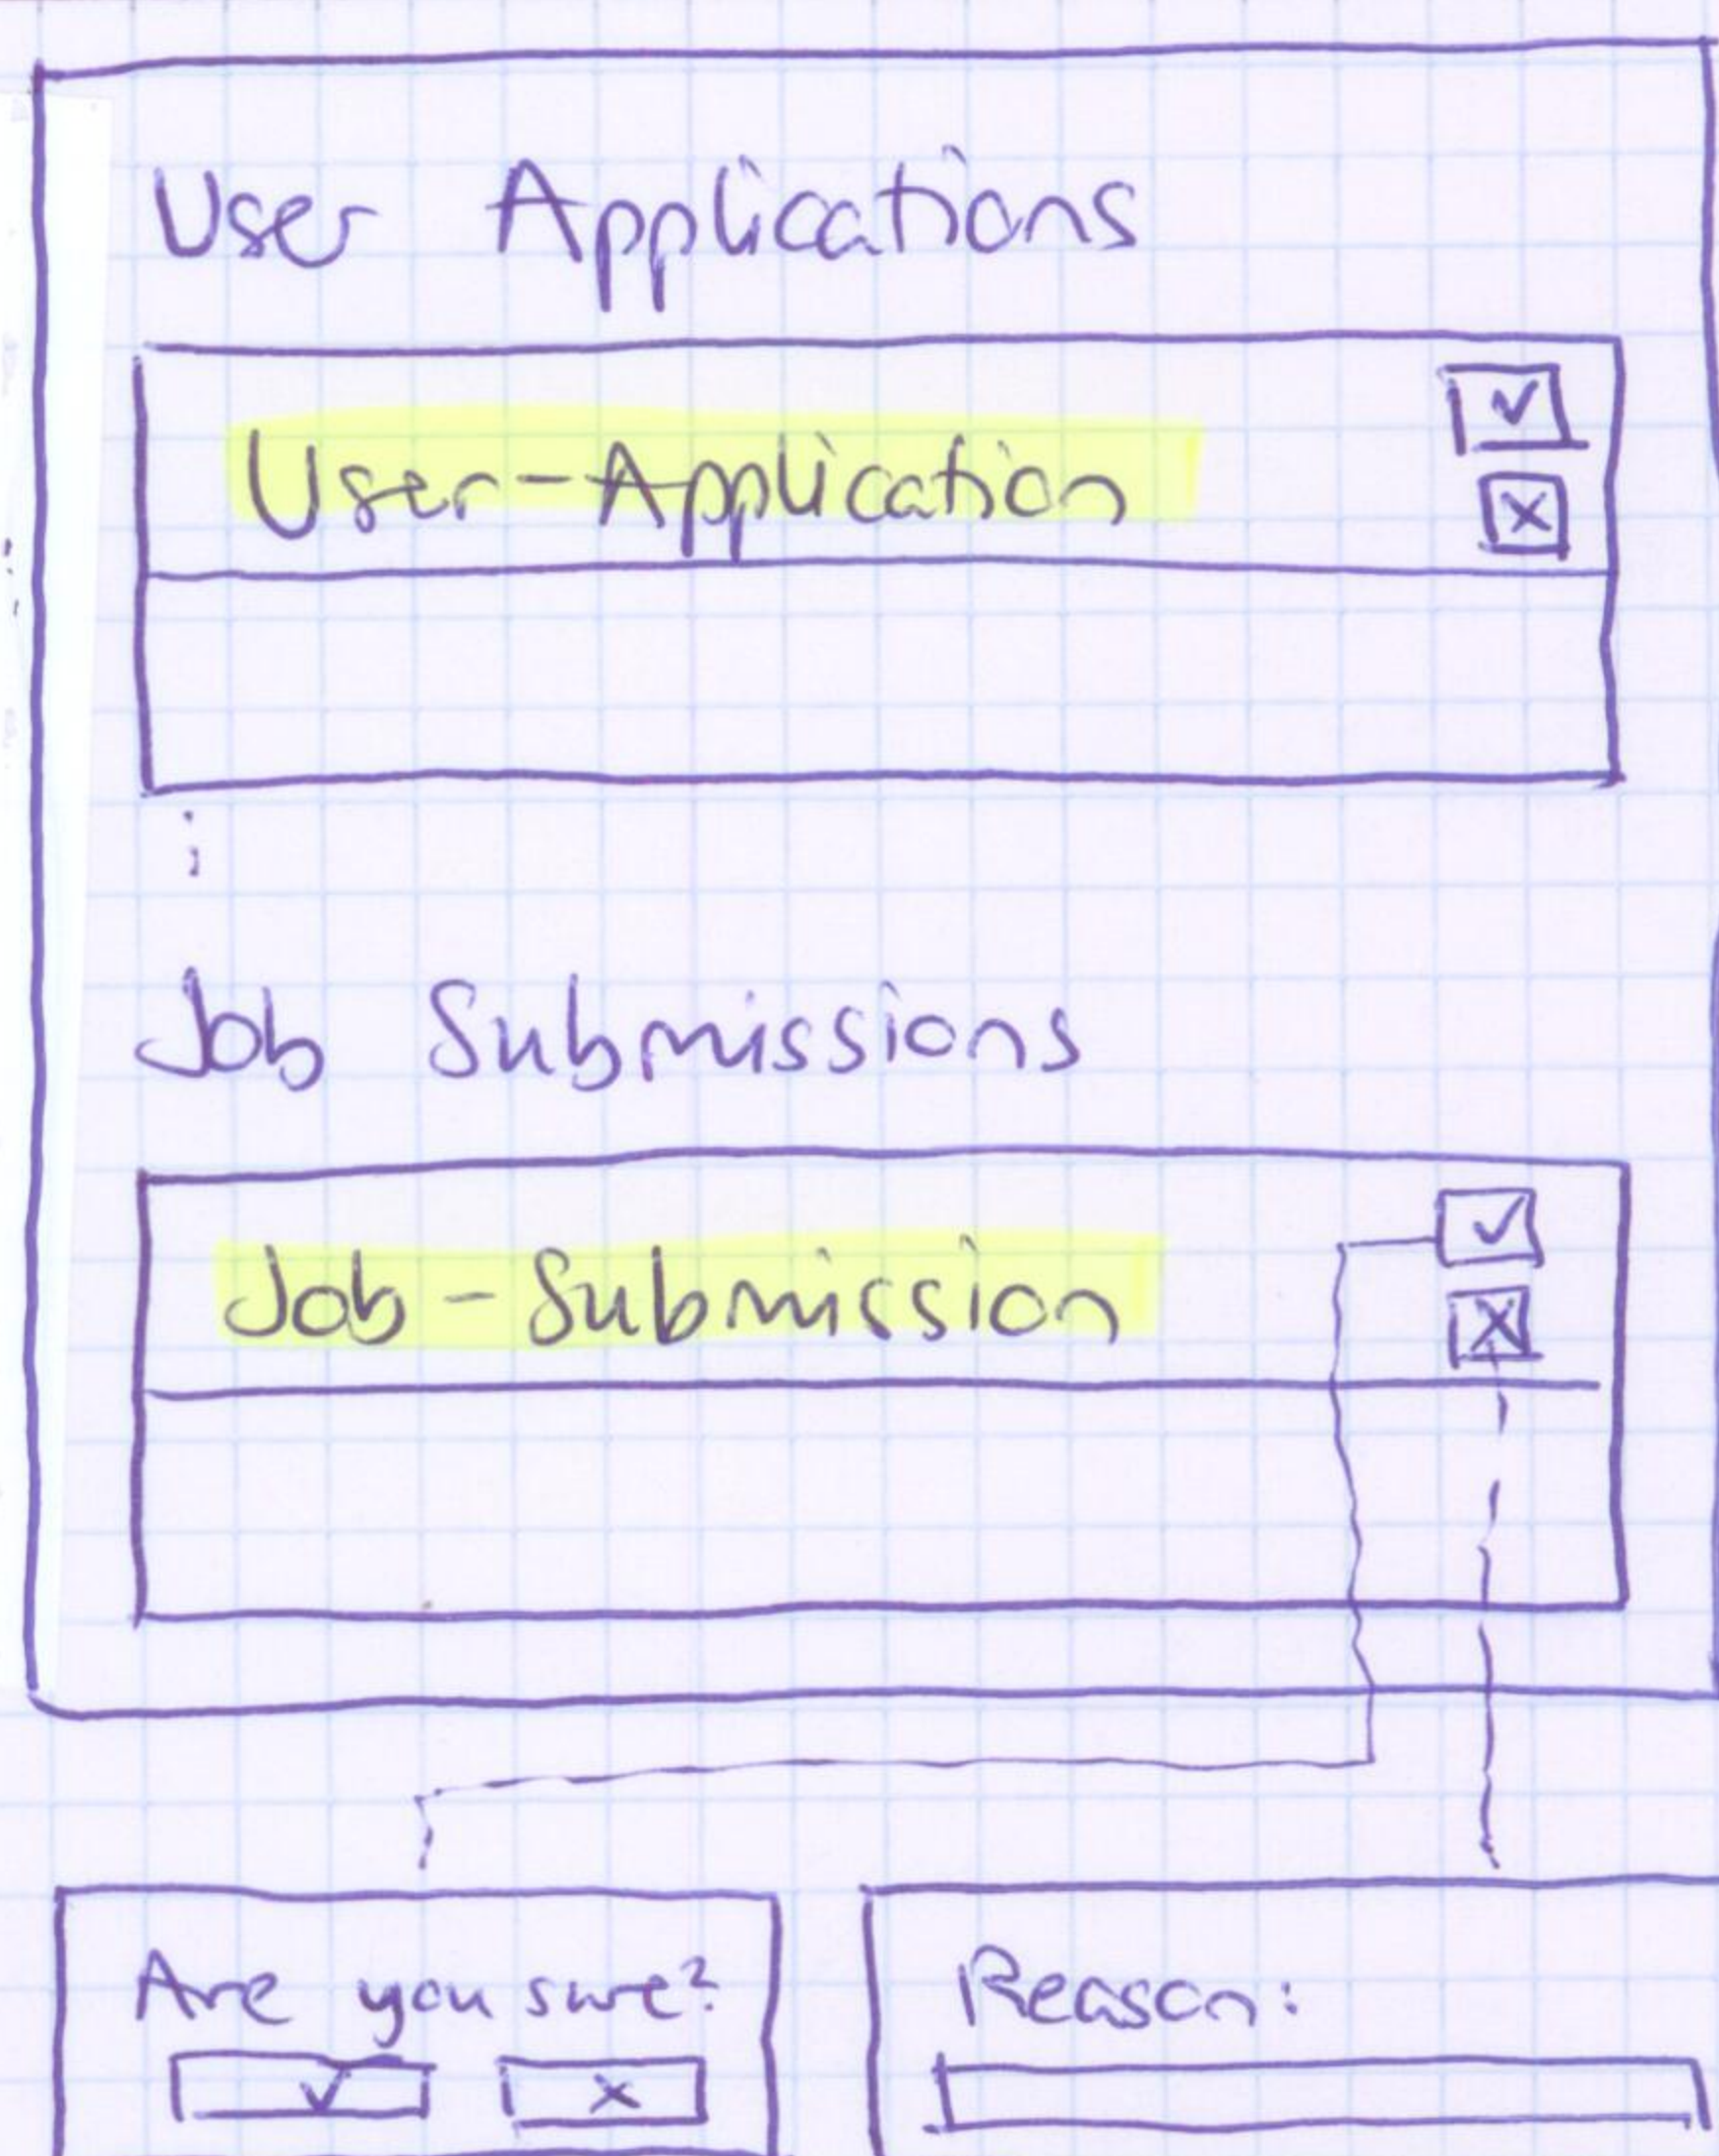

Register and allows modification. Each of your job-items is displayed in its own My-Job-Posting component.

Verified companies and accepted job-offers become unverified/open should they be updated by the user. Should serve as a good overview of your account and display private details like messages from the admin with reason why user application was denied (same for job submissions). Critical actions should ask for confirmation.

## Admin

This is the key point for moderating the website. Accessible through the link in the footer, the admin can reach this page with a list of all unverified users and unapproved job submissions. Each User-Application and Job-Submission displays all its submitted data in its own sub-component. Users and jobs can be accepted or denied. Each action asks for confirmation from the admin through browser message / popup window. Denied applications/submissions require a message from the admin with a short statement for the user such that he can fix the missing/faulty details.

## Job-Create

Form that allows registered & verified users to create job offers by filling all editable job-details into the fields. Should include input validation and error feedback.

Job-Edit works very similarly and allows a user to update a job-offer. Shows previously entered data for modification.

## Job-Detail

Shows all details of a job and its company in a presentable way. Accessible for everyone by clicking on job-item in job list component. Format 'empty' data and replace with text. (e.g. no EndDate → 'open ended contract'.)
