

Connections Frontend - Backend:

* Required

User Login

FE

BE

- E-Mail *
- Password *

Login succeeds or fails

- Token

User Registration

FE

BE

- E-Mail *
- Password *
- Name *
- User Type: Company ← currently set (default)
- Street
- Zip Code
- Place
- Website
- Description

A new user can submit a user registration but must then wait until the admin either accepts or denies the application.

⇒ Upon registration, the data is stored in the database in the backend. However, the status of the newly created user is still "open". A successful login becomes available only after the application was accepted by the admin, which then also changes the status of the user.

Job Posting

BE

FE

Requires valid token for successfully registered user →

- Title *
- Description
- Required Skills
- Start Date
- End Date
- Job Posting Valid Until Date
- Workload Minimum
- Workload Maximum
- Languages
- Place/Location
- Salary Type (Monthly, Hourly, One Time Payment)
- Salary Amount

The backend adds some data automatically, like "date posted" or the user submitting the job posting.

Since not all values actually exist for the given job details (e.g. a job might not have a set start/end date) the front-end may display something like "by arrangement" or "open ended" for these details.
